

Investigating NBA Player Statistics

Team Name: Ashir Raza, Vincent Huang, Mina Kim, Elizabeth Berengneur

2020-10-28

Your written report goes here! Before you submit, make sure your code chunks are turned off with `echo = FALSE` and there are no warnings or messages with `warning = FALSE` and `message = FALSE`

1) Introduction and Data

Our dataset consists of various statistics for every player who has played in the NBA within the 1996-2020 seasons, ranging from their home country and college of origin, draft year and round, and various stats such as average points, rebounds, and assists per game. This dataset was found on Kaggle (<https://www.kaggle.com/justinas/nba-players-data>) and was originally collected using the NBA Stats API by Justinas Cirtautus, who created this dataset by filling in missing rows of data manually using data from the Basketball Reference website.

Each observation/case in the dataset represents a player and their corresponding qualities/ draft stats/game stats for a specific season. Some variables such as draft number remain constant while other such as ppg change depending on the season. A player who played for ten seasons within the timespan analyzed will have ten observations. The variables in the dataset include different aspects pertaining to the player- whether it be information about how/ when they were drafted, what country and college they are from, physical characteristics (height, weight), and game stats (number of games played, rebounds).

Basketball is a constantly evolving game, and how NBA players played twenty years ago vs today vary tremendously. From the rise of the three point shooter to the fall of the big man, it's amazing how a game's rules can be so fluid over time. Our group wishes to use this dataset to try and find more about how the highest flight of professional basketball has evolved over the years. Check the following article for more information: https://www.espn.com/nba/story/_/id/29113310/seven-ways-nba-changed-michael-jordan-bulls.

Research Question: How have the quality traits NBA teams desire in a draftee changed over time?

We will be looking at season to determine the time, the draft round and number to determine the relative importance of each player, and a way to combine a player's height, weight, and ingame statistical information in order to present an ideal position or skillset desired by teams for that draft year. We might additionally scrape data from other sources about a player's salary to determine more about their career's overall value.

Our general hypothesis is that over the past twenty or so seasons, shorter and lighter players have been prioritized in drafts. Scoring, assisting, and true shooting averages will also likely have an upwards trend, while rebounding will probably have a downwards trend. Teams will have shifted from desiring a tall and heavy rebounder and shot-blocker towards a smaller and quicker shooter with more offensive capabilities.

2) Methodology and Data

If we take a closer look at our data set by year, we can see that although there are some outliers, consistent data on players across the league started being kept around the year 1981. For this reason, we will pick 1996 as our start year for our analysis and filter out any recorded data from before 1996. We will also cap off our analysis before the 2019 season, as that season was ongoing at the time of upload, so metrics like gp, pts, reb, etc. would not be complete.

This data set is biased towards the offensive side of the ball, with there being no defensive statistics such as blocks or steals in this data set, so contributions given by players who devoted much of their time to the

defensive side of the ball might be neglected.

To start, we will create a new dataset with just newly drafted players. This will remove all returning players to allow us to simply look at how drafting has changed from 1981 to 2018 and to try to view what qualities NBA teams value over time. We shall also group all the draft picks by multiples of ten (ie: picks 1-10, 11-20, etc...) in order to organize the data more efficiently. These groups will be referred to as draft groups for the remainder of this report.

We shall now group by both season and draft group, and find the mean of both height and weight, the two most obvious physical characteristics of an NBA player, for each season and draft group. We will graph these over time, with the draft groups differentiated by color, in order to determine if NBA teams' value of height and weight have changed at all over time.

Height vs Season
of NBA rookies since 1996

Based off of the two visualizations, it seems that both height and weight similarly changed over time. Both appeared to increase for the first few seasons and then decrease for the next few seasons, and then increase once again for latest few seasons from 1996 to 2019. This pattern was especially noticeable for picks 1-10, which are the most valuable picks.

3) Results
